

One Final Example for What it Really Means for a Country's Population to Age

- In 2000, in the United States there were approximately 72k centenarians
- By 2050, the number will exceed 834k – a fourteen fold increase (using the Bureau's "middle range", high range estimates exceed 4MM)
- If we made them all live together...
 - We would need a city the size of Detroit. There are only ten cities in the U.S. today large enough to hold all of the centenarians who will be around in about forty years.
- And remember that the populations of nearly all of the developed world are already older than the U.S. today...

Over time a slightly higher percent of 100+ are male – up to 18% in 2050.
